

Known Errors and Problems

Errors and problems are listed for the individual versions as far as they are known to us.

Version 1.2:

Version 1.2 runs under NT based systems (NT, 2000, XP) with the help of an emulator which is integrated in Windows. The emulator has not been supported by Microsoft any more for several years now. Several errors and problems are known with the emulator and some can affect the use of Version 1.2. The following Problems might occur:

- Small calculation errors
- The program can reject user inputs with decimal point or comma
- Errors during printing

An upgrade to Version 1.3 will solve these problems.

Version 1.3:

No problems or errors are known with the present build.

Version 1.4:

No problems or errors are known with the present build.

Version 2.3:

No problems or errors are known with the present build.

Version 2.4:

In program builds before 2.4.1.377 a calculation error has been found in the calculation of pooled estimates of Type A. The evaluated uncertainty can be underestimated. All users should therefore update to the latest build. The update is available in the Download Section free of charge.

With the present build, no problems or errors are known.
